# Rittal – **RiZone Management Pack for Microsoft System Center Operations Manager**

RITTAL

RiZone Management Pack

for Microsoft System Center Operations Manager

The transparent representation of RiZone-managed infrastructure permits a new, comprehensive view of data centre operations: The logical assignment of physical infrastructure to an application provided by a server. This opens up new possibilities for the definition of availability and energy optimisation.

Benefits:

- Opportunity to display data centre efficiency
- Availability is improved thanks to an optimised basis for planning
- Determination of consumption values down to the level of a single server
- Energy optimisation while at the same time increasing availability

RiZone and SCOM communicate via a pro-enabled management pack. The management pack automatically transfers all relevant information from the physical infrastructure into the System Center Operations Manager.

The depth of integration enables the administrator to escape his merely reactive role in data centre planning and operation and to make an active contribution. Information on power consumption, available rack space or the location of installed servers can be presented directly in the Operations Manager.

Microsoft
GOLD CERTIFIED
Partner

Hönigsberg & Düvel
Datentechnik GmbH

Through Rittal's membership in the Microsoft System Center Alliance, customers are offered access to a whole network of matched solutions built around the use of RiZone and SCOM.

The high level of expertise demonstrated by integration partner Hönigsberg & Düvel Datentechnik GmbH in respect of the RiZone Management Pack is for Rittal the key to successful optimised integration of RiZone into the System Center Operations Manager infrastructure.
